abeka algebra 2: The Well-Trained Mind Susan Wise Bauer, Jessie Wise, 2009-05-04 If you're a parent who has decided to educate your children yourself, this book is the first you should buy.—?Washington Times The Well-Trained Mind will instruct you, step by step, on how to give your child an academically rigorous, comprehensive education from preschool through high school—one that will train him or her to read, to think, to ?understand?, to be well-rounded and curious about learning. Veteran home educators Jessie Wise and Susan Wise Bauer outline the classical pattern of education called the trivium, which organizes learning around the maturing capacity of the child's mind and comprises three stages: the elementary school grammar stage, the middle school logic stage, and the high school rhetoric stage. Using this theory as your model, you'll be able to instruct your child in all levels of reading, writing, history, geography, mathematics, science, foreign languages, rhetoric, logic, art, and music, regardless of your own aptitude in those subjects. This newly revised edition contains completely updated ordering information for all curricula and books, new and expanded curricula recommendations, new material on using computers and distance-learning resources, answers to common questions about home education, information about educational support groups, and advice on practical matters such as working with your local school board, preparing a high school transcript, and applying to colleges.

abeka algebra 2: Multivariable Calculus with Linear Algebra and Series William F. Trench, Bernard Kolman, 2014-05-10 Multivariable Calculus with Linear Algebra and Series presents a modern, but not extreme, treatment of linear algebra, the calculus of several variables, and series. Topics covered range from vectors and vector spaces to linear matrices and analytic geometry, as well as differential calculus of real-valued functions. Theorems and definitions are included, most of which are followed by worked-out illustrative examples. Comprised of seven chapters, this book begins with an introduction to linear equations and matrices, including determinants. The next chapter deals with vector spaces and linear transformations, along with eigenvalues and eigenvectors. The discussion then turns to vector analysis and analytic geometry in R^3 ; curves and surfaces; the differential calculus of real-valued functions of n variables; and vector-valued functions as ordered m -tuples of real-valued functions. Integration (line, surface, and multiple integrals) is also considered, together with Green's and Stokes's theorems and the divergence theorem. The final chapter is devoted to infinite sequences, infinite series, and power series in one variable. This monograph is intended for students majoring in science, engineering, or mathematics.
