where $\mathbf{A}$ is a matrix of coefficients, $\mathbf{x}$ is a vector of dependent variables, and $\mathbf{B}$ and $\mathbf{C}$ are matrices or vectors representing inputs and constants.

Methods for Solving Using Linear Algebra

Several methods exist for solving differential equations using linear algebra:

- **Eigenvalue Method:** Utilizes eigenvalues and eigenvectors to solve systems of linear differential equations.
- **Laplace Transform:** Converts differential equations into algebraic equations for easier manipulation.
- **Numerical Methods:** Approaches such as Runge-Kutta methods for approximating solutions.
