**science fair projects for anatomy: *Animals and Science Education*** Michael P. Mueller, Deborah J. Tippins, Arthur J. Stewart, 2017-06-15 This book discusses how we can inspire today's youth to engage in challenging and productive discussions around the past, present and future role of animals in science education. Animals play a large role in the sciences and science education and yet they remain one of the least visible topics in the educational literature. This book is intended to cultivate research topics, conversations, and dispositions for the ethical use of animals in science and education. This book explores the vital role of animals with/in science education, specimens, protected species, and other associated issues with regards to the role of animals in science. Topics explored include ethical, curriculum and pedagogical dimensions, involving invertebrates, engineering solutions that contribute to ecosystems, the experiences of animals under our care, aesthetic and contemplative practices alongside science, school-based ethical dialogue, nature study for promoting inquiry and sustainability, the challenge of whether animals need to be used for science whatsoever, reconceptualizing museum specimens, cultivating socioscientific issues and epistemic practice, cultural integrity and citizen science, the care and nurturance of gender-balanced curriculum choices for science education, and theoretical conversations around cultivating critical thinking skills and ethical dispositions. The diverse authors in this book take on the logic of domination and symbolic violence embodied within the scientific enterprise that has systematically subjugated animals and nature, and emboldened the anthropocentric and exploitative expressions for the future role of animals. At a time when animals are getting excluded from classrooms (too dangerous! too many allergies! too dirty!), this book is an important counterpoint. Interacting with animals helps students develop empathy, learn to care for living things, engage with content. We need more animals in the science curriculum, not less. **science fair projects for anatomy:** The Well-Trained Mind Susan Wise Bauer, Jessie Wise, 2009-05-04 If you're a parent who has decided to educate your children yourself, this book is the first you should buy.—?Washington Times The Well-Trained Mind will instruct you, step by step, on how to give your child an academically rigorous, comprehensive education from preschool through high school—one that will train him or her to read, to think, to ?understand?, to be well-rounded and curious about learning. Veteran home educators Jessie Wise and Susan Wise Bauer outline the classical pattern of education called the trivium, which organizes learning around the maturing capacity of the child's mind and comprises three stages: the elementary school grammar stage, the middle school logic stage, and the high school rhetoric stage. Using this theory as your model, you'll be able to instruct your child in all levels of reading, writing, history, geography, mathematics, science, foreign languages, rhetoric, logic, art, and music, regardless of your own aptitude in those subjects. This newly revised edition contains completely updated ordering information for all curricula and books, new and expanded curricula recommendations, new material on using computers and distance-learning resources, answers to common questions about home education, information about educational support groups, and advice on practical matters such as working with your local school board, preparing a high school transcript, and applying to colleges.
