business to engineering: The Engineering-Business Nexus Steen Hyldgaard Christensen, Bernard Delahousse, Christelle Didier, Martin Meganck, Mike Murphy, 2018-11-14 Fascinating and compelling in equal measure this volume presents a critical examination of the multilayered relationships between engineering and business. In so doing the study also stimulates ethical reflection on how these relationships either enhance or inhibit strategies to address vital issues of our time. In the context of geopolitical, economic, and environmental tendencies the authors explore the world that we should want to create and the role of the engineer and the business manager in this endeavor. Throughout this volume the authors identify periods of alignment and periods of tension between engineering and business. They look at focal points of the engineering-business nexus related to the development of capitalism. The book explores past and present movements to reshape, reform, or reject this nexus. The volume is informed by questions of importance for industry as well as for higher education. These are: What kinds of conflict arise for engineers in their

attempts to straddle both professional and organizational commitments? How should professionals be managed to avoid a clash of managerial and professional cultures? How do engineers create value in firms and corporations? What kinds of tension exist between higher education and industry? What challenges does the neoliberal entrepreneurial university pose for management, faculty, students, society, and industry? Should engineering graduates be ready for work, and can they possibly be? What kinds of business issues are reflected in engineering education curricula, and for what purpose? Is there a limit to the degree of business hybridization in engineering degree programs, and if so, what would be the criterion for its definition? Is there a place in engineering education curricula for reflective critique of assumptions related to business and economic thinking? One ideal of management and control comes to the fore as the Anthropocene - the world transformed into an engineered artefact which includes human existence. The volume raises the question as to how engineering and business together should be considered, given the fact that the current engineering-business nexus remains embedded within an economic model of continual growth. By addressing macro-level issues such as energy policy, sustainable development, globalization, and social justice this study will both help create awareness and stimulate development of self-knowledge among practitioners, educators, and students thereby ultimately addressing the need for better informed citizens to safeguard planet Earth as a human life supporting system.

business to engineering: Digital Business Engineering Clemente Minonne, 2022-01-27 Digital Business Transformation, Digitalisation, Business Strategy, Business Process, Business Analysis, Business Architecture, Business Models This book serves practitioners as a guide to digital business engineering. It was consciously conceived and prepared from a methodological perspective, thereby avoiding a strongly technological approach, rather focusing on the presentation of methods and instruments. Its basis is a tried and tested framework model that can be understood as the ideal management cycle of digital business engineering. The control loop consists of goal-setting (Chapter 1: Setting a Business Strategy), implementation (Chapters 2-5), and success assessment (Chapter 6: Validating the Success of Business Transformation) and is located in an outer circuit. The operational implementation phases of digital business engineering are part of the inner cycle: Defining a Business Case (Chapter 2), Eliciting the Business Processes (Chapter 3), Deriving the Business Requirements (Chapter 4), and Transforming the Business Architecture (Chapter 5). The book follows a didactic structure: Each chapter includes learning objectives, summaries, and repetition questions with solutions that can help the reader to reassure themselves and strengthen their knowledge. Users who want to familiarise themselves with the field of digital business engineering thus have material at their disposal that is ideal for self-study. But these modules can also help experienced digital business engineers to deepen their knowledge in their organisation and to strengthen their overall methodological competence.

business to engineering: e-Business in Construction Chimay J. Anumba, Kirti Ruikar, 2009-01-21 With a number of disparate, often geographically distributed, organisations involved in the delivery of construction projects, there has been considerable interest in e-business tools within the construction industry. These tools open up a range of possibilities for the industry to rethink existing processes and working methods, so their use is increasingly common. Nevertheless, there has been little definitive guidance for practitioners, researchers and students on the major issues in electronic business from a construction perspective. By bringing together 16 contributions from research and industry covering theory, technological issues, practical implementation and legal matters, and illustrated with a number of case studies, e-Business in Construction fills that gap. Starting with the theoretical aspects of e-commerce and moving on to consider the specifics of the construction context, it includes a mechanism for the assessment of the e-readiness of construction sector organisations. The middle part of the book focuses on the role of various technologies in e-business, with examples included as appropriate. This is followed by a discussion of practical, legal and trust issues. The potential of next generation of information and communication technologies is also addressed. With a fine blend of theoretical and practical aspects of e-commerce in construction, and well illustrated with a number of industrial case studies, e-Business in
