economics with business degree: Educational Innovation in Economics and Business VI

Tor A. Johannessen, Ansgar Pedersen, Kurt Petersen, 2013-04-17 Business education and business research has often been criticized by the business community, which claims that much of it is mainly directed at the establishment of teachers and researchers themselves, instead of distributing their knowledge to the business community. It may seem that many universities and other research institutions have turned into mere 'knowledge manufacturers', where the emphasis is more on the output volume than on quality of relevance, with little or no consideration for the end users. As universities and corporations attempt to prepare management to be alert to future changes, improved and even brand new teaching methodologies are required. The main focus of the present volume is on the distribution and selection of new knowledge. How can business educators deliver new knowledge to students and the business community more rapidly than before? How should we define the core business curriculum when new knowledge becomes old knowledge?

economics with business degree: *Teaching Innovations in Economics* María del Carmen Valls Martínez, José-María Montero, 2024-10-31 This book highlights the latest technological innovations in economics education. Economics, as a discipline, not only studies the relationship between ends and scarce means, which can be used alternatively, but also serves as a social science that uses historical data to predict future events—a task complicated by the influence of human behavior. In economics, a solid theoretical foundation alone is insufficient; practical application requires a deep understanding of statistics. With the vast amount of information available today, data processing is now performed using specialized software. Consequently, teaching economics demands a wide range of complex skills that have significantly evolved in recent years, driven by the growing interest in educational innovation among professors and scientists, further accelerated by advancements in new technologies. Moreover, economics education is increasingly aligned with the global concern for sustainability, as emphasized in the United Nations' Agenda 2030. Professors are now integrating sustainability into syllabi and teaching methodologies. This book covers key topics such as: Technological and innovative advancements in economics education. New teaching-learning theories and models in economics education. The impact of digital transformation on economics education. The role of artificial intelligence in economics education. Addressing special educational needs in economics education. Evaluation of the teaching-learning process in economics. Assessment of student learning in economics. Development of materials and tools for economics education. Final projects (Undergraduate and Master's) in economics. Authored by leading professors and researchers in the field, this book presents a collection of chapters that rigorously explore teaching innovations in economics.

economics with business degree: Business Leaders and New Varieties of Capitalism in

Post-Communist Europe Katharina Bluhm, Bernd Martens, Vera Trappmann, 2013-09-23 Business leaders exert extraordinary influence on institution building in market economies but they think and act within institutional settings. This book combines both an elite approach with a varieties-of-capitalism approach. Comparing Poland, Hungary and East and West Germany, we perceive the transformations in East Central Europe and in Germany after 1989 as being intertwined. Based on a joint survey, this book seeks to measure the level of the convergence of ideas among European business leaders, assuming it to be more extensive than the institutional convergence expected under the dominance of neoliberal discourse. Analyzing the institutional framework, organizational features like size, ownership and labour relations, and subjective characteristics like age, social origin, career patterns and attitudes of the recent business elites, we found significant differences between countries and the types of organization. The growing importance of economic degrees and internationalization shows astonishingly little explanatory power on the views of business leaders. The idea of a coordinated market economy is still relatively widespread among Germans, while their Hungarian and Polish counterparts are more likely to display a minimalist view of corporate responsibility to society and adverse attitudes towards

employee representation. However, their attitudes frequently tend to be inconsistent, which mirrors the mixed type of capitalism in East Central Europe.

economics with business degree: Women and Distance Education Christine von Prummer, 2005-07-12 This book provides valuable insights into the situation of women in distance education around the world. A wide variety of evidence from different countries supports the conclusion that open and distance learning has the potential to provide equal opportunities in higher and continuing education and that these are currently being missed. The author provides conclusive evidence that distance education, while involving a degree of risk to the stability of families and relationships, etc., nevertheless offers women a chance which, on balance, is worth taking. The author says that it is up to distance education policy makers to provide a framework for women students which will limit the risks and maximise the opportunities. Drawing on fascinating case study material, this book presents vital information for these policy makers.
