MATHEMATICS REQUIREMENTS

MATHEMATICS IS A CORNERSTONE OF COMPUTER SCIENCE AT CMU. APPLICANTS SHOULD HAVE COMPLETED ADVANCED MATHEMATICS COURSES, USUALLY THROUGH CALCULUS. PROFICIENCY IN ALGEBRA, GEOMETRY, AND PRE-CALCULUS IS ALSO ESSENTIAL. CMU EXPECTS INCOMING STUDENTS TO DEMONSTRATE STRONG ANALYTICAL AND PROBLEM-SOLVING SKILLS DEVELOPED THROUGH THEIR MATH COURSEWORK.

Science and Computing Foundations

While computer science-specific courses are valuable, CMU also looks for a strong foundation in sciences such as physics or chemistry. These subjects promote logical thinking and an understanding of fundamental scientific principles. Additionally, experience with programming or computer science basics, such as coding in languages like Python or Java, is highly recommended but not always mandatory.

Standardized Test and Coursework Expectations

Although standardized testing policies may evolve, strong SAT or ACT scores, particularly in math and science sections, enhance an applicant's profile. High school coursework should include:

- Four years of mathematics including calculus
- At least three years of science including physics or chemistry
- Exposure to computer science or programming, if available
- Strong performance in advanced placement (AP) or international baccalaureate (IB) courses related to STEM

Academic Prerequisites for Graduate Applicants

The graduate program at CMU's School of Computer Science is designed for students with a solid undergraduate background in computer science or closely related fields. The prerequisites at this level focus on ensuring that incoming students possess a comprehensive understanding of core computer science concepts.

Work across nearly all domains is becoming more data driven, affecting both the jobs that are available and the skills that are required. As more data and ways of analyzing them become available, more aspects of the economy, society, and daily life will become dependent on data. It is imperative that educators, administrators, and students begin today to consider how to best prepare for and keep pace with this data-driven era of tomorrow. Undergraduate teaching, in particular, offers a critical link in offering more data science exposure to students and expanding the

supply of data science talent. Data Science for Undergraduates: Opportunities and Options offers a vision for the emerging discipline of data science at the undergraduate level. This report outlines some considerations and approaches for academic institutions and others in the broader data science communities to help guide the ongoing transformation of this field.

cmu computer science prerequisites: Disrupting the Digital Humanities Dorothy Kim, Jesse Stommel, 2018 All too often, defining a discipline becomes more an exercise of exclusion than inclusion. Disrupting the Digital Humanities seeks to rethink how we map disciplinary terrain by directly confronting the gatekeeping impulse of many other so-called field-defining collections. What is most beautiful about the work of the Digital Humanities is exactly the fact that it can't be tidily anthologized. In fact, the desire to neatly define the Digital Humanities (to filter the DH-y from the DH) is a way of excluding the radically diverse work that actually constitutes the field. This collection, then, works to push and prod at the edges of the Digital Humanities - to open the Digital Humanities rather than close it down. Ultimately, it's exactly the fringes, the outliers, that make the Digital Humanities both lovely and rigorous. This collection does not constitute yet another reservoir for the new Digital Humanities canon. Rather, our aim is less about assembling content as it is about creating new conversations. Building a truly communal space for the digital humanities requires that we all approach that space with a commitment to: 1) creating open and non-hierarchical dialogues; 2) championing non-traditional work that might not otherwise be recognized through conventional scholarly channels; 3) amplifying marginalized voices; 4) advocating for students and learners; and 5) sharing generously to support the work of our peers. cmu computer science prerequisites: *Studying the Novice Programmer* E. Soloway, J. C.

Spohrer, 2013-12-02 Parallel to the growth of computer usage in society is the growth of programming instruction in schools. This informative volume unites a wide range of perspectives on the study of novice programmers that will not only inform readers of empirical findings, but will also provide insights into how novices reason and solve problems within complex domains. The large variety of methodologies found in these studies helps to improve programming instruction and makes this an invaluable reference for researchers planning studies of their own. Topics discussed include historical perspectives, transfer, learning, bugs, and programming environments.

cmu computer science prerequisites: Human-Computer Interaction Steve Howard, Judy Hammond, Gitte Lindgaard, 2013-06-05 The theme of the 1997 INTERACT conference, 'Discovering New Worlds ofHCI', signals major changes that are taking place with the expansion of new technologies into fresh areas of work and leisure throughout the world and new pervasive, powerful systems based on multimedia and the internet. HCI has a vital role to play in these new worlds, to ensure that people using the new technologies are empowered rather than subjugated to the technology that they increasingly have to use. In addition, outcomes from HCI research studies over the past 20 years are now finding their way into many organisations and helping to improve and enhance work practices. These factors have strongly influenced the INTERACT'97 Committee when creating the conference programme, with the result that, besides the more traditional HCI research and education focus found in previous INTERACT conferences, one strand of the 1997 conference has been devoted to industry and another to multimedia. The growth in the IFIP TCI3 committee itself reflects the expansion ofHCI into new worlds. Membership oflFIP TC13 has risen to now include representatives of 24 IFIP member country societies from many parts of the world. In 1997, IFIP TCl3 breaks new ground by holding its sixth INTERACT conference in the Asia-Pacific region. This is a significant departure from previous INTERACT conferences, that were all held in Europe, and is especially important for the Asia-Pacific region, as HCI expands beyond its traditional base.

cmu computer science prerequisites: Genetic Algorithms for Machine Learning John J. Grefenstette, 2012-12-06 The articles presented here were selected from preliminary versions presented at the International Conference on Genetic Algorithms in June 1991, as well as at a special Workshop on Genetic Algorithms for Machine Learning at the same Conference. Genetic algorithms are general-purpose search algorithms that use principles inspired by natural population genetics to evolve solutions to problems. The basic idea is to maintain a population of knowledge structure that represent candidate solutions to the problem of interest. The population evolves over time through a process of competition (i.e. survival of the fittest) and controlled variation (i.e. recombination and mutation). Genetic Algorithms for Machine Learning contains articles on three topics that have not been the focus of many previous articles on GAs, namely concept learning from examples, reinforcement learning for control, and theoretical analysis of GAs. It is hoped that this sample will serve to broaden the acquaintance of the general machine learning community with the major areas of work on GAs. The articles in this book address a number of central issues in applying GAs to machine learning problems. For example, the choice of appropriate representation and the corresponding set of genetic learning operators is an important set of decisions facing a user of a genetic algorithm. The study of genetic algorithms is proceeding at a robust pace. If experimental progress and theoretical understanding continue to evolve as expected, genetic algorithms will continue to provide a distinctive approach to machine learning. Genetic Algorithms for Machine Learning is an edited volume of original research made up of invited contributions by leading researchers.
