Economics education in elementary and secondary schools is essential in order to prepare a responsible citizenry that can cope with economic problems and issues. This ERIC Digest examines: (1) the primary goal of economics education; (2) current economics curriculum patterns; and (3) methods of improving the economics curriculum. The basic concepts of economics education should be included in a social studies core curriculum and curriculum patterns should include: (1) the use of separate economics courses; (2) the general infusion of economics principles and concepts into other courses; or (3) the utilization of specific units of economics instruction within existing courses on other subjects. One method of improving economics education is to combine an infusion strategy in grades K-12 with a required one semester high school course. Four characteristics of a sound secondary school economics course include: (1) an emphasis on basic concepts and principles; (2) teaching strategies that elicit active student learning; (3) the connection of concepts and principles to other school subjects and citizenship roles; and (4) the application of knowledge to public issues and problems. The use of quantitative analysis and macro-economics should be emphasized. A 16-item bibliography is appended. (JHP).

high school economics curriculum: An International Perspective on Economic Education William B. Walstad, 2012-12-06 Economics is taught in some form in the secondary schools of nations throughout the world. The subject is rarely taught in elementary schools, and while economics courses are offered in universities, the majority of students end their formal education with secondary school. Thus, the best opportunity for the economic education of the youth of a nation occurs in secondary schools. This book examines economic education at this critical level of the educational system. The teaching of economics in secondary schools varies across countries. These differences occur because of history, the structure of education, and other national factors. At the same time, there are common elements in the economic education of many countries, especially in content coverage. This contrast between the common features and the uniqueness of economic education in secondary schools of major industrial nations exemplifies the international perspective presented in this book. The international perspective is developed in the six sections of the volume. The first section discusses why nations should include economics in school curricula, and presents a framework for teaching economics that should have global appeal. Dissension and consensus on economic issues among North American and European economists are examined in the second section. The third section surveys the U.S. research literature on precollege economic education and assesses the current state of economics instruction in U.S. schools. The economics curricula and educational practices in seven other nations -- the U.K., Canada, Japan, Germany, Austria, Korea, and Australia -- are described in the fourth and fifth sections. The fifth section also presents international comparisons of economic understanding based on national testing in six of those nations. The sixth and final section explores the role of economic education in centrally planned economies, and its effects on the transition to a market economy, using Russia, Bulgaria, and China as case studies.

high school economics curriculum: Effective Economic Education in the Schools William B. Walstad, John Charles Soper, 1991 The Developmental Economic Education Program (DEEP) was launched in 1964 by the Joint Council on Economic Education as an experimental program in three school districts. By 1989 there were 1,836 school districts enrolled in DEEP, covering some 39 percent of the precollege student population. This book tells the story of DEEP, an effort to improve the economics education curriculum by involving teachers, administrators, universities, and businesses in a curriculum change partnership. This current look at the DEEP experience is divided into five major parts. Part I consists of four chapters that give a rationale for economic education and explain in more detail the features of the DEEP model. Part II focuses on the research and evaluation that have been conducted over the 25-year history of DEEP and on related studies of economic understanding among students in secondary and elementary grades. The next two parts offer case studies of how DEEP works. Part III looks at DEEP operations and issues in four diverse states. Part IV shows how the DEEP process works in six different school districts. In part V the focus shifts from the present to the future; these chapters discuss the future of DEEP in the context of educational reform, requirements for new curriculum materials, needs of school districts, and leadership from the Joint Council on Economic Education.
