The incorporation of algebra allows anyone to relate any one thing to another using a defined and constant standard. Any question about the value of an object or idea can be assigned a variable title. This variable is inserted into a directed algebraic equation with the goal of ascertaining certain values. With algebraic equations, it is possible to compare oranges to apples as long as certain constant properties are defined. If X is the universe, Algebra can help anyone compare the universe to an infinite pool of values with any number of goals in mind.

Verbal or word problems solving in mathematics is a major nightmare for students. One of the reasons is that they don't have a good technique to tackle this kind of problems. The goal of this book is to teach a sound technique based on 6 key steps: -Understanding the problem; -Finding the unknowns; -Simplifying the problem; -Drawing figures if necessary; -Identifying the key facts and translating them into algebraic terms; -Stating the main relationships between the variables and the data. The last two, solving the equation and checking the result, are common practice. In this work, we'll go through a thinking process, repeated throughout the book, to solve word problems. The most important thing to keep in mind is how we bridge the gap between the problem and the finding of its main equations. This technique will make students more confident when they face verbal problems.

punchline bridge to algebra publisher: Algebraic Equations (Speedy Study Guide)

Speedy Publishing LLC, 2014-09-29 One exceptionally important part of knowing how to do algebra is knowing all of the equations. This can be very difficult for a student who is first learning how to do algebra, and it can be very difficult for one to sit down to learn them. One great way for persons to avoid simply staring at the equation for hours is to use an algebra equation study guide. The guide contains useful exercises a student can do in order to learn the problems.
