the evolution of: The Evolution of Sex John Maynard Smith, 1978-08-24 The question of why organisms reproduce sexually is still a matter of controversy. In this account, Professor Maynard Smith considers the selective forces responsible for the origin and evolution of sexual reproduction and genetic recombination, using quantitative population genetics arguments to support his ideas. The relative importance of individual and group selection processes are also considered. the aim is to give a clear statement of the theoretical issues, and present enough of the evidence to show what kinds of facts are relevant. It is hoped that where crucial evidence is missing, experimentalists and

field workers may be encouraged to collect the relevant data. The author does not claim to solve all the problems he raises, but this clear and well-argued account should provide stimulating reading for advanced undergraduate students and research workers in evolutionary theory.

the evolution of: The Evolution of Atheism Stephen LeDrew, 2015-10-01 In *The Evolution of Atheism*, Stephen LeDrew argues that militant atheists have more in common with religious fundamentalists than they would care to admit, advancing what LeDrew calls secular fundamentalism. LeDrew draws on public relations campaigns, publications, podcasts, and in-depth interviews to explore the belief systems, internal logics, and self-contradictions of atheists. He argues that evolving understandings of what atheism means, and how it should be put into action, are threatening to irrevocably fragment the movement.

the evolution of: The Evolution of Cognition Cecilia M. Heyes, Ludwig Huber, 2000 In the last decade, evolutionary psychology has come to refer exclusively to research on human mentality and behavior, motivated by a nativist interpretation of how evolution operates. This book encompasses the behavior and mentality of nonhuman as well as human animals and a full range of evolutionary approaches. Rather than a collection by and for the like-minded, it is a debate about how evolutionary processes have shaped cognition. The debate is divided into five sections: Orientations, on the phylogenetic, ecological, and psychological/comparative approaches to the evolution of cognition; Categorization, on how various animals parse their environments, how they represent objects and events and the relations among them; Causality, on whether and in what ways nonhuman animals represent cause and effect relationships; Consciousness, on whether it makes sense to talk about the evolution of consciousness and whether the phenomenon can be investigated empirically in nonhuman animals; and Culture, on the cognitive requirements for nongenetic transmission of information and the evolutionary consequences of such cultural exchange.

the evolution of: Once We Were Hunters: A Study Of The Evolution Of Vascular Disease Giovanni Vincent Belcaro, 2001-10-19 We emerged after millions of years of evolution, first in the rainforest and then in the dry savanna bush. This nomadic way of life was characterised by seasonal and geographical variation of food; scarcity, particularly of high-energy food containing fats and sugar; and walking as the main form of exercise, with sudden bursts of energy either to catch prey or to avoid becoming prey. Society was organised into structured, small-groups, contact among whom was very limited under normal conditions. After this 25 million-year period of evolution, however, we have now entered a period of de-evolution, in which we shape the world instead of it shaping us. We now have plenty of food (particularly fats, sugar and proteins), with regular 'social' feedings even when we do not need food. Food in supermarkets is not subject to seasonal variations and we are fairly static physically (watching television being more frequent than exercise), without sudden use of high levels of energy. Socially, there are too many people, too much contact, causing stress and confusion. We must look to the small pockets of our former way of life which still survive in some parts of Africa to explain our real evolutionary background and nature. We cannot go back, but knowing who we are will help us to survive and to create a better world, according to our true evolutionary plan./a

the evolution of: The Evolution of Parental Care Mathias Kölliker, 2012-08-09 Parental care

includes a wide variety of traits that enhance offspring development and survival. It is taxonomically widespread and is central to the maintenance of biodiversity through its close association with other phenomena such as sexual selection, life-history evolution, sex allocation, sociality, cooperation and conflict, growth and development, genetic architecture, and phenotypic plasticity. This novel book provides a fresh perspective on the study of the evolution of parental care based on contributions from some of the top researchers in the field. It provides evidence that the dynamic nature of family interactions, and particularly the potential for co-evolution among family members, has contributed to the great diversity of forms of parental care and life-histories across as well as within taxa. The *Evolution of Parental Care* aims to stimulate students and researchers alike to pursue exciting new directions in this fascinating and important area of behavioural and evolutionary biology. It will be of relevance and use to those working in the fields of animal behaviour, ecology, evolution, and genetics, as well as related disciplines such as psychology and sociology.

the evolution of: *The Evolution of Exudativory in Primates* Anne M. Burrows, Leanne T Nash, 2010-09-11 I first became involved in research into primate behavior and ecology in 1968, over 40 years ago, driven by a quest for a better understanding of the natural context of primate evolution. At that time, it was virtually unknown that primates can exploit exudates as a major food source. I was certainly unaware of this myself. By good fortune, I was awarded a postdoctoral grant to work on lemurs with Jean-Jacques Petter in the general ecology division of the Muséum National d'Histoire Naturelle in Brunoy, France. This provided the launching-pad for my first field study of lesser mouse lemurs in Madagascar, during which I gained my initial inklings of exudate feeding. It was also in Brunoy that I met up with Pierre Charles- Dominique, who introduced me to pioneering observations of exudate feeding he had made during his field study of five lorisiform species in Gabon. This opened my eyes to a key feeding adaptation that has now been reported for at least 69 primate species in 12 families (Smith, Chap. 3) – almost 20% of extant primate species. So exudativory is now firmly established as a dietary category for p- mates, alongside the long-recognized classes of faunivory (including insectivory), frugivory, and folivory. Soon after I encountered Charles-Dominique, he published the first synthetic account of his Gabon field study in a French language journal (Charles-Dominique 1971).

the evolution of: *The Evolution of Man* Matthias Hermanns, 1955

the evolution of: *Evolution's Destiny* R J P Williams, Ros Rickaby, 2012-08-31 This book is written as an addition to Darwin's work and that of molecular biologists on evolution so as to include views of it from the point of view of chemistry rather than just from our knowledge of the biology and genes of organisms. By concentrating on a wide range of chemical elements, not just those in traditional organic compounds, we show that there is a close relationship between the geological or environmental chemical changes from the formation of Earth and those of organisms from the time of their origin. These are considerations which Darwin or other scientists could not have explored until very recent times since sufficient analytical data were not available. They lead us to suggest that there is a combined geo- and bio-chemical evolution, that of an ecosystem, which has had a systematic chemical development. In this development the arrival of new very similar species is shown to be by random Darwinian competitive selection processes such that a huge variety of species coexist with only minor differences in chemistry and advantages. This is in agreement with previous studies. On the large scale of evolution of very different organisms, and over greater timescales, by way of contrast, we observe that groups of species have special, different, chemical features and function. It is more difficult to understand how they evolved and therefore we examine their chemical development in detail. Overall there is a cooperative evolution of a chemical system driven by capture of energy, mainly from the sun, and its degradation in which the chemistry of both the environment and organisms are facilitating intermediates. We shall suggest that the overall drive of the whole joint system is to optimise the rate of this energy degradation. Since the environmental changes are inorganic and relatively fast they move inevitably to equilibrium. The living part of the system, the organisms, under the influence of this inevitable environmental change are forced to follow but as they are increasingly energised and their reactions are slow, they move further away

from equilibrium. We are able to explore the ways in which this chemical system evolved, recognising that as complexity of the chemistry of organisms increased, they had to be formed from more and more compartments and to become part of a chemically cooperative overall activity. They could not remain as isolated species. Only in the last chapter do we attempt to make a connection between the changing chemistry of organisms with the coded molecules of each cell which have to exist to explain reproduction.

the evolution of: The Ecology and Evolution of Heliconius Butterflies Chris D. Jiggins, 2017-01-27 The Heliconius butterflies are one of the classic systems in evolutionary biology and have contributed hugely to our understanding of evolution over the last 150 years. Their dramatic radiation and remarkable mimicry has fascinated biologists since the days of Bates, Wallace, and Darwin. The Ecology and Evolution of Heliconius Butterflies is the first thorough and accessible treatment of the ecology, genetics, and behaviour of these butterflies, exploring how they offer remarkable insights into tropical biodiversity. The book starts by outlining some of the evolutionary questions that Heliconius research has helped to address, then moves on to an overview of the butterflies themselves and their ecology and behaviour before focussing on wing pattern evolution, and finally, speciation. Richly illustrated with 32 colour plates, this book makes the extensive scientific literature on Heliconius butterflies accessible to a wide audience of professional ecologists, evolutionary biologists, entomologists, and amateur collectors.

the evolution of: The Evolution of Everything Matt Ridley, 2016-05-19 We are taught that the world is a top-down place. Generals win battles; politicians run countries; scientists discover truths; artists create genres; inventors make breakthroughs; teachers shape minds; philosophers change minds; priests teach morality; businessmen lead businesses; environmentalists save the planet. Not just individuals, but institutions too: Goldman Sachs, the Communist Party, the Catholic Church, Al Qaeda - these are said to shape the world. This is more often wrong than right. Top downery is the source of most of our worst problems in the past - why Hitler won an election, why the sub-prime bubble happened, why Africa lingered in poverty when Asia did not, why the Euro is a disaster - and will be the scourge of this century too. And although we neglect, defy and ignore them, bottom-up trends still shape the world. The growth of technology, the sanitation-driven health revolution, the quadrupling of farm yields so that more land could be released for nature - these were largely emergent phenomena. So was the internet, the mobile phone revolution and the rise of Asia. In this wide-ranging, highly opinionated non-fiction narrative, Ridley draws on anecdotes from science, economics, history, politics and philosophy and examples drawn from the scientific literature, from historical narratives and from personal anecdotes.

the evolution of: Evolutionary Anatomy of the Primate Cerebral Cortex Dean Falk, Kathleen R. Gibson, 2001-04-19 Studies of brain evolution have moved rapidly in recent years, building on the pioneering research of Harry J. Jerison. This book provides reviews of primate (including human) brain evolution. The book is divided into two sections, the first gives new perspectives on the developmental, physiological, dietary and behavioural correlates of brain enlargement. It has long been recognized, however, that brains do not merely enlarge globally as they evolve, but that their cortical and internal organization also changes in a process known as reorganization. Species-specific adaptations therefore have neurological substrates that depend on more than just overall brain size. The second section explores these neurological underpinnings for the senses, adaptations and cognitive abilities that are important for primates. With a prologue by Stephen J. Gould and an epilogue by Harry J. Jerison, this is an important reference work for all those working on brain evolution in primates.

the evolution of: The Economics of Post-Communist Transition Olivier Blanchard, 1997-08-28 Transition in Central and Eastern Europe has led to a U-shaped response of output: a sharp decline in output followed by recovery. Most of the countries of Central Europe seem now firmly on the upside; most of the countries of Eastern Europe are still close to the bottom of the U: an optimistic view is that they are now negotiating the turn. Olivier Blanchard, a distinguished economist who has worked on transition since its beginning, is one of the first to present a unified analysis of the process of transition. The U-shaped response of output, its causes and its implications, are the subject of this book. The text is split into four chapters. The first reviews the facts; the second focuses on the two basic mechanisms underlying transition: reallocation and restructuring; the third looks more closely at a number of issues, from the interactions between restructuring and privatization to the nature of the labour market in transition; the fourth chapter pulls the material together in an analytical model of transition. This model is then used to discuss policy issues, from the design of privatization to the role of fiscal policy in transition.
